Duration 1.15 hrs

HTML + Javascript

Create a HTML form to accept input from user for product-name, product-Rate and Quantity. Form must have a button “add”. On clicking this button, create a Java Script Object based upon the input to store information about product + its discount value. Use the rules below to calculate discount as per the following:

(Use function in object)

- For quantity below 25, no discount.
 - For quantity between 25 to 50, offer 10% discount.
 - For quantity above 50, offer 20% discount.
- Use Javascript class preferably.
 - Create 2 functions in object/class - one to calculate discount and one to display details of the product object
 - If using JSON, do not use lambda for functions, does not work

JQuery:

Given the following HTML table. Provide a text field to search and a button. On button click, search for the name in the table and highlight:

No need to use <form> tag here, directly can use form elements like text field and button
